

CMSC 21  
2nd Semester AY 2022-2023  
LECTURE 4  
Jhoanna R. Olana - 202211140

Item 1:

What is the output of the following program?

```
#include <stdio.h>

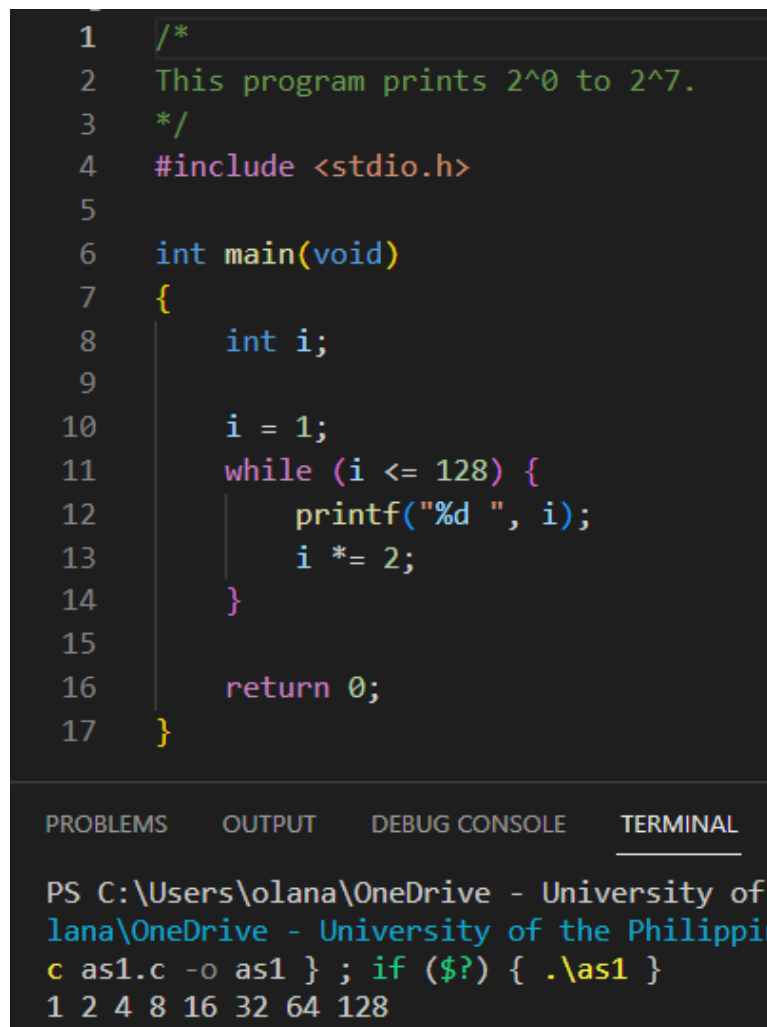

int main(void)
{
    int i;

    i = 1;
    while (i <= 128) {
        printf("%d ", i);
        i *= 2;
    }

    return 0;
}
```

Answer:

**1 2 4 8 16 32 64 128**

The image shows a code editor with a dark background. The code is written in C and is the same as the one in the previous block. Below the code editor, there is a terminal window with a light background. The terminal shows the command prompt 'PS C:\Users\olana\OneDrive - University of the Philippines...' followed by the command 'c as1.c -o as1 } ; if (\$?) { .\as1 }'. The output of the program is displayed in the terminal: '1 2 4 8 16 32 64 128'.

```
1  /*
2  This program prints 2^0 to 2^7.
3  */
4  #include <stdio.h>
5
6  int main(void)
7  {
8      int i;
9
10     i = 1;
11     while (i <= 128) {
12         printf("%d ", i);
13         i *= 2;
14     }
15
16     return 0;
17 }
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL

PS C:\Users\olana\OneDrive - University of the Philippines\OneDrive - University of the Philippines> c as1.c -o as1 } ; if (\$?) { .\as1 }

1 2 4 8 16 32 64 128

## Item 2:

Which one of the following statements is not equivalent to the other two (assuming that the loop bodies are the same)?

- a) `while (i < 10) {...}`
- b) `for (; i < 10;) {...}`
- c) `do {...} while (i < 10);`

Given that the loop bodies are the same (including the initialize, condition and update parts), **all are equivalent to each other.**

```
1  /*
2  This program shows how a loop statement may be constructed using several loop controls as
3  long as the portions initialize, condition, and update are the same.
4  Written in 2023 by Jhoanna Olana.
5  */
6  #include <stdio.h>
7
8  int main(void) {
9      int i = 0;                // Initialize
10
11      // ---- while loop ----
12      // while (i < 10) {        // Condition
13      //     printf("%d ", i);
14      //     i++;                // Update
15      // }
16
17      // ---- for loop ----
18      // for ( ; i < 10; ) {      // Condition
19      //     printf("%d ", i);
20      //     i++;                // Update
21      // }
22
23      // ---- do-while loop ----

Item 7:

A road network can be represented using graphs. Assuming we have points / stations a, b, c, d, e, f, g, and h, we can represent a direct path from a point to another point using arrows.

For example, based on the graph below:

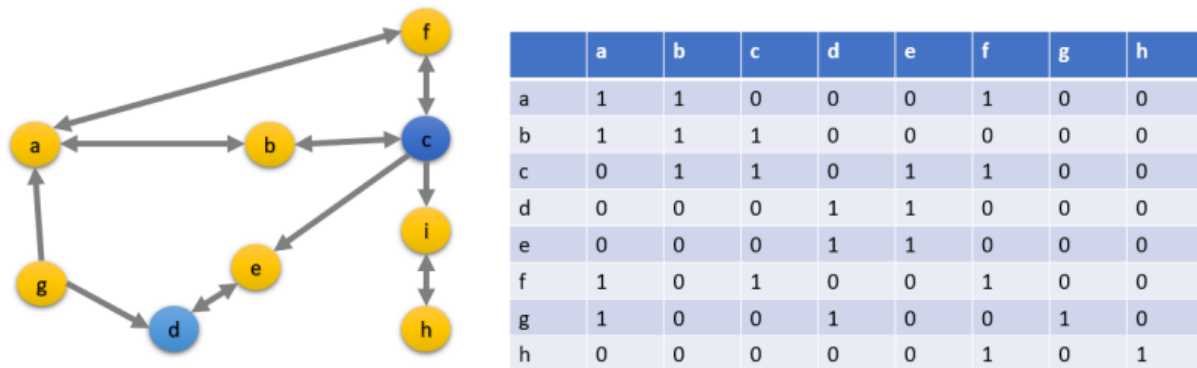

- There is a two-way path between point a and point b, point a and point f, point f and point c, and point d and e.
- There is a one-way path from point c to point i but no direct path between point i to point c.

All of the nodes are points/destinations, but the blue ones specifically represent charging stations. The road network between these points/destinations can be represented using an adjacency matrix of Booleans (0s and 1s), as shown below.

For instance,  $a \rightarrow b = 1$  and  $b \rightarrow a = 1$  given that there's a two-way direct path between a and b.

Meanwhile,  $a \rightarrow c = 0$  since there is no direct path between a and c. Moreover,  $a \rightarrow g = 0$  but  $g \rightarrow a =$

1 since there is a one-way path from point g to point a.

As a programming assignment:

1. Declare and initialize a `road_networks` multidimensional array that represents the adjacency matrix.
2. Display the adjacency matrix. Put a bracket to the points/destinations that are considered as charging stations, e.g. `[c]`, `[d]`.
3. Given a point / destination, determine the nearest charging station. For example, if you are in point a, the nearest charging station is point c. If you are in point e, the nearest charging station is point d.
4. Bonus: Use a macro to define the size of the 2d array.

```

77     /*
78     Arrays to_C and to_D tell if there is a path from a certain point to point C/D (point -> C/D = 1).
79     To create these arrays, we iterate through the points(k's) between the given source and the charging stations
80     and test if there is an edge/path from the source to the charging stations through the k's.
81     Example:
82     General Case: If P -> k = 1 and k -> C = 1, then P -> C = 1.
83     Case1 (based on the given): A directly to C = 0, but A -> B = 1 and B -> C = 1. Thus, A -> C = 1.
84     */
